Type Package

Title Quantitative Analysis of Textual Data

Author Kenneth Benoit [aut, cre],
Paul Nulty [aut],
Pablo Barberá [ctb],
Kohei Watanabe [ctb],
Benjamin Lauderdale [ctb]

Version 0.8.2-0

Date 2015-07-31

Description A fast, flexible toolset for for the management, processing, and
quantitative analysis of textual data in R.

License GPL-3

Depends R (>= 3.2.1)

Imports methods,
utils,
stats,
Matrix (>= 1.1),
data.table (>= 1.9.3),
SnowballC,
wordcloud,
proxy,
parallel,
Rcpp,
ca,
stringi

LinkingTo Rcpp, RcppArmadillo

Suggests knitr,
lda,
topicmodels,
jsonlite (>= 0.9.10),
streamR,
tm (>= 0.6),
slam,

---

quanteda-package   *An R package for the quantitative analysis of textual data.*

Description

A set of functions for creating and managing text corpora, extracting features from text corpora, and analyzing those features using quantitative methods.

More detailed description, and some examples, to go here.

Author(s)

Ken Benoit and Paul Nulty

---

applyDictionary   *apply a dictionary or thesarus to an object*

Description

Convert features into equivalence classes defined by values of a dictionary object.

Usage

```
applyDictionary(x, dictionary, ...)

## S3 method for class 'dfm'
applyDictionary(x, dictionary, exclusive = TRUE,
  valuetype = c("glob", "regex", "fixed"), case_insensitive = TRUE,
  capkeys = !exclusive, verbose = TRUE, ...)
```

Arguments

x	object to which dictionary or thesaurus will be supplied
dictionary	the [dictionary](#)-class object that will be applied to x
...	not used
exclusive	if TRUE, remove all features not in dictionary, otherwise, replace values in dictionary keys with keys while leaving other features unaffected
valuetype	how to interpret dictionary values: "glob" for "glob"-style wildcard expressions (the format used in Wordstat and LIWC formatted dictionary values); "regex" for regular expressions; or "fixed" for exact matching (entire words, for instance)
case_insensitive	
	ignore the case of dictionary values if TRUE
capkeys	if TRUE, convert dictionary or thesaurus keys to uppercase to distinguish them from other features
verbose	print status messages if TRUE

Value

an object of the type passed with the value-matching features replaced by dictionary keys

Note

Selecting only features defined in a "dictionary" is traditionally known in text analysis as a dictionary method, even though technically this is more like a thesarus. If a more truly thesaurus-like application is desired, set keeponly = FALSE to convert features defined as values in a dictionary into their keys, while keeping all other features.

Examples

```
myDict <- dictionary(list(christmas = c("Christmas", "Santa", "holiday"),
                          opposition = c("Opposition", "reject", "notincorpus"),
                          taxglob = "tax*",
                          taxregex = "tax.+$",
                          country = c("United_States", "Sweden")))
myDfm <- dfm(c("My Christmas was ruined by your opposition tax plan.",
               "Does the United_States or Sweden have more progressive taxation?"),
             ignoredFeatures = stopwords("english"), verbose = FALSE)
myDfm

# glob format
applyDictionary(myDfm, myDict, valuetype = "glob")
applyDictionary(myDfm, myDict, valuetype = "glob", case_insensitive = FALSE)

# regex v. glob format: note that "united_states" is a regex match for "tax*"
applyDictionary(myDfm, myDict, valuetype = "glob")
applyDictionary(myDfm, myDict, valuetype = "regex", case_insensitive = TRUE)

# fixed format: no pattern matching
applyDictionary(myDfm, myDict, valuetype = "fixed")
applyDictionary(myDfm, myDict, valuetype = "fixed", case_insensitive = FALSE)
```

---

bigrams   *Create bigrams*

Description

Create bigrams

Usage

```
bigrams(text, window = 1, concatenator = "_", include.unigrams = FALSE,
  ignoredFeatures = NULL, skipGrams = FALSE, ...)
```

Arguments

text	character vector containing the texts from which bigrams will be constructed
window	how many words to be counted for adjacency. Default is 1 for only immediately neighbouring words. This is only available for bigrams, not for ngrams.
concatenator	character for combining words, default is _ (underscore) character

include.unigrams

> if TRUE, return unigrams as well

ignoredFeatures

> a character vector of features to ignore

skipGrams   If FALSE (default), remove any bigram containing a feature listed in `ignoredFeatures`, otherwise, first remove the features in `ignoredFeatures`, and then create bigrams. This means that some "bigrams" will actually not occur as adjacent features in the original text. See examples.

...   provides additional arguments passed to [tokenize](#)

Value

a character vector of bigrams

Author(s)

Ken Benoit and Kohei Watanabe

Examples

```
bigrams("The quick brown fox jumped over the lazy dog.")
bigrams(c("The quick brown fox", "jumped over the lazy dog."))
bigrams(c("The quick brown fox", "jumped over the lazy dog."), window=2)
bigrams(c("I went to tea with her majesty Queen Victoria.", "Does tea have extra caffeine?"))
bigrams(c("I went to tea with her majesty Queen Victoria.", "Does tea have extra caffeine?"),
        ignoredFeatures=stopwords("english"))
bigrams(c("I went to tea with her majesty Queen Victoria.", "Does tea have extra caffeine?"),
        ignoredFeatures=stopwords("english"), skipGrams=TRUE)
```

---

changeunits   *change the document units of a corpus*

Description

For a corpus, recast the documents down or up a level of aggregation. "Down" would mean going from documents to sentences, for instance. "Up" means from sentences back to documents. This makes it easy to reshape a corpus from a collection of documents into a collection of sentences, for instance.

Usage

```
changeunits(corp, to = c("sentences", "paragraphs", "documents"), ...)
```

Arguments

corp   corpus whose document units will be reshaped

to   new documents units for the corpus to be recast in

...   passes additional arguments to [segment](#)

Value

a corpus object with the documents defined as the new units

Examples

```
# simple example
mycorpus <- corpus(c(textone = "This is a sentence.  Another sentence.  Yet another.",
                     textwo = "Premiere phrase.  Deuxieme phrase."),
                 docvars = data.frame(country=c("UK", "USA"), year=c(1990, 2000)),
                 notes = "This is a simple example to show how changeunits() works.")
metadoc(mycorpus, "language") <- c("english", "french")
summary(mycorpus)
summary(changeunits(mycorpus, to="sentences"), showmeta=TRUE)

# example with inaugural corpus speeches
mycorpus2 <- subset(inaugCorpus, Year>2004)
mycorpus2
paragCorpus <- changeunits(mycorpus2, to="paragraphs")
paragCorpus
summary(paragCorpus, 100, showmeta=TRUE)
## Note that Bush 2005 is recorded as a single paragraph because that text used a single
## \n to mark the end of a paragraph.
```

---

collocations	*Detect collocations from text*

Description

Detects collocations (currently, bigrams and trigrams) from texts or a corpus, returning a data.frame of collocations and their scores, sorted in descending order of the association measure. Words separated by punctuation delimiters are not counted as adjacent and hence are not eligible to be collocations.

Usage

```
collocations(x, ...)

## S3 method for class 'character'
collocations(x, method = c("lr", "chi2", "pmi", "dice",
  "all"), size = 2, n = NULL, ...)

## S3 method for class 'corpus'
collocations(x, method = c("lr", "chi2", "pmi", "dice",
  "all"), size = 2, n = NULL, ...)
```

Arguments

x	a text, a character vector of texts, or a corpus
...	additional parameters passed to [tokenize](#). If wanted to include collocations separated by punctuation, then you can use this to send removePunct = TRUE to [tokenize](#).
method	association measure for detecting collocations. Let i index documents, and j index features, n_{ij} refers to observed counts, and m_{ij} the expected counts in a collocations frequency table of dimensions $(J - size + 1)^2$. Available measures are computed as:

"lr" The likelihood ratio statistic G^2, computed as:

$$2 * \sum_i \sum_j (n_{ij} * log\frac{n_{ij}}{m_{ij}})$$

"chi2" Pearson's χ^2 statistic, computed as:

$$\sum_i \sum_j \frac{(n_{ij} - m_{ij})^2}{m_{ij}}$$

"pmi" point-wise mutual information score, computed as log n_{11}/m_{11}

"dice" the Dice coefficient, computed as $n_{11}/n_{1.} + n_{.1}$

"all" returns all of the above

size   length of the collocation. Only bigram (n=2) and trigram (n=3) collocations are
                implemented so far. Can be c(2,3) (or 2:3) to return both bi- and tri-gram
                collocations.

n   the number of collocations to return, sorted in descending order of the requested
                statistic, or G^2 if none is specified.

Details

Because of incompatibilities with the join operations in [data.table](#) when input files have slightly
different encoding settings, collocations currently converts all text to ASCII prior to processing.
We hope to improve on this in the future.

Value

A data.table of collocations, their frequencies, and the computed association measure(s).

collocations(subset(inaugCorpus, Year>1980), method="pmi", size=3, n=10)
```

---

convert   *convert a dfm to a non-quanteda format*

Description

Convert a quanteda [dfm-class](#) object to a format useable by other text analysis packages. The general function convert provides easy conversion from a dfm to the document-term representations used in all other text analysis packages for which conversions are defined. To make the usage as consistent as possible with other packages, however, quanteda also provides direct conversion functions in the idiom of the foreign packages, for example as.wfm to coerce a dfm into the wfm format from the **austin** package, and quantedaformat2dtm for using a dfm with the **topicmodels** package.

Usage

```
convert(x, to, ...)

## S3 method for class 'dfm'
convert(x, to = c("lda", "tm", "stm", "austin", "topicmodels"),
  ...)

as.wfm(x)

## S3 method for class 'dfm'
as.wfm(x)

as.DocumentTermMatrix(x, ...)

## S3 method for class 'dfm'
as.DocumentTermMatrix(x, ...)

dfm2ldaformat(x)

## S3 method for class 'dfm'
dfm2ldaformat(x)

quantedaformat2dtm(x)

## S3 method for class 'dfm'
quantedaformat2dtm(x)
```

Arguments

x	dfm to be converted
to	target conversion format, consisting of the name of the package into whose document-term matrix representation the dfm will be converted:

  "lda" a list with components "documents" and "vocab" as needed by lda.collapsed.gibbs.sampler
           from the **lda** package

  "tm" a DocumentTermMatrix from the **tm** package

  "stm" the format for the **stm** package

  "austin" the wfm format from the **austin** package

  "topicmodels" the "dtm" format as used by the **topicmodels** package

...   not used here

Details

We recommend using convert() rather than the specific functions. In fact, it's worth considering
whether we should simply remove all of them and **only** support calling these through 'convert()'.

We may also use this function, eventually, for converting other classes of objects such as a 'corpus'
or 'tokenizedList'.

as.wfm converts a quanteda dfm into the wfm format used by the austin package.

as.DocumentTermMatrix will convert a quanteda dfm into the **tm** package's DocumentTermMatrix
format.

dfm2ldaformat provides converts a dfm into the list representation of terms in documents used by
tghe **lda** package.

quantedaformat2dtm provides converts a dfm into the sparse simple triplet matrix representation
of terms in documents used by the **topicmodels** package.

Value

A converted object determined by the value of to (see above). See conversion target package
documentation for more detailed descriptions of the return formats.

For individual converters in the foreign package idioms, return values are:

DETAILS

dfm2ldaformat returns a list with components "documents" and "vocab" as needed by lda.collapsed.gibbs.sampler

quantedaformat2dtm returns a "dtm" sparse matrix object for use with the **topicmodels** package.

Note

The **tm** package version of as.TermDocumentMatrix allows a weighting argument, which sup-
plies a weighting function for TermDocumentMatrix. Here the default is for term frequency weight-
ing. If you want a different weighting, apply the weights after converting using one of the **tm**
functions.

Examples

```
mycorpus <- subset(inaugCorpus, Year>1970)
quantdfm <- dfm(mycorpus, verbose=FALSE)

# austin's wfm format
austindfm <- as.wfm(quantdfm)
identical(austindfm, convert(quantdfm, to="austin"))

# tm's DocumentTermMatrix format
tmdfm <- as.DocumentTermMatrix(quantdfm)
str(tmdfm)
```

```
# stm package format
stmdfm <- convert(quantdfm, to="stm")
str(stmdfm)

# topicmodels package format
topicmodelsdfm <- quantedaformat2dtm(quantdfm)
identical(topicmodelsdfm, convert(quantdfm, to="topicmodels"))

# lda package format
ldadfm <- convert(quantdfm, to="lda")
str(ldadfm)
identical(ldadfm, stmdfm[1:2])
# calling dfm2ldaformat directly
ldadfm <- dfm2ldaformat(quantdfm)
str(ldadfm)
```

---

corpus   *constructor for corpus objects*

Description

Creates a corpus from a document source. The current available document sources are:

- a character vector (as in R class char) of texts;
- a corpusSource-class object, constructed using textfile;
- a **tm** VCorpus class corpus object, meaning that anything you can use to create a **tm** corpus, including all of the tm plugins plus the built-in functions of tm for importing pdf, Word, and XML documents, can be used to create a quanteda corpus.

Corpus-level meta-data can be specified at creation, containing (for example) citation information and notes, as can document-level variables and document-level meta-data.

Usage

```
corpus(x, ...)

## S3 method for class 'character'
corpus(x, enc = NULL, encTo = "UTF-8",
  docnames = NULL, docvars = NULL, source = NULL, notes = NULL,
  citation = NULL, ...)

## S3 method for class 'corpusSource'
corpus(x, ...)

## S3 method for class 'VCorpus'
corpus(x, ...)

is.corpus(x)

## S3 method for class 'corpus'
c1 + c2
```

Arguments

x	a source of texts to form the documents in the corpus, a character vector or a [corpusSource-class](#) object created using [textfile](#).
...	additional arguments
enc	a string specifying the input encoding for texts in the corpus. Must be a valid entry in [stri_enc_list](#)(), since the code in corpus.character will convert this to encTo using [stri_encode](#). We recommend that you do **not** use enc, since if left NULL (the default) then corpus() will detect the input encoding(s) and convert automatically.
	Currently only one input encoding can be specified for a collection of input texts, meaning that you should not mix input text encoding types in a single corpus call. However if you suspect multiple encodings, omit the enc argument and corpus() will detect and convert each file automatically.
encTo	target encoding, default is UTF-8. Unless you have strong reasons to use an alternative encoding, we strongly recommend you leave this at its default. Must be a valid entry in [stri_enc_list](#)()
docnames	Names to be assigned to the texts, defaults to the names of the character vector (if any), otherwise assigns "text1", "text2", etc.
docvars	A data frame of attributes that is associated with each text.
source	A string specifying the source of the texts, used for referencing.
notes	A string containing notes about who created the text, warnings, To Dos, etc.
citation	Information on how to cite the corpus.
c1	corpus one to be added
c2	corpus two to be added

Details

The + operator for a corpus object will combine two corpus objects, resolving any non-matching [docvars](#) or [metadoc](#) fields by making them into NA values for the corpus lacking that field. Corpus-level meta data is concatenated, except for source and notes, which are stamped with information pertaining to the creation of the new joined corpus.

There are some issues that need to be addressed in future revisions of quanteda concerning the use of factors to store document variables and meta-data. Currently most or all of these are not recorded as factors, because we use stringsAsFactors=FALSE in the [data.frame](#) calls that are used to create and store the document-level information, because the texts should always be stored as character vectors and never as factors.

Value

A corpus class object containing the original texts, document-level variables, document-level meta-data, corpus-level metadata, and default settings for subsequent processing of the corpus. A corpus consists of a list of elements described below, although these should only be accessed through accessor and replacement functions, not directly (since the internals may be subject to change). The structure of a corpus classed list object is:

$documents	A data frame containing the document level information, consisting of [texts](#), user-named [docvars](#) variables describing attributes of the documents, and metadoc document-level metadata whose names begin with an underscore character, such as _language.

$metadata	A named list set of corpus-level meta-data, including source and created (both generated automatically unless assigned), notes, and citation.
$settings	Settings for the corpus which record options that govern the subsequent processing of the corpus when it is converted into a document-feature matrix (dfm). See settings.
$tokens	An indexed list of tokens and types tabulated by document, including information on positions. Not yet fully implemented.

is.corpus returns TRUE if the object is a corpus

Note

When x is a VCorpus object, the fixed metadata fields from that object are imported as document-level metadata. Currently no corpus-level metadata is imported, but we will add that soon.

    summary(mytmCorpus, showmeta=TRUE)
```

```
    data(acq)
    summary(corpus(acq), 5, showmeta=TRUE)

    tmCorp <- VCorpus(VectorSource(inaugTexts[49:57]))
    quantCorp <- corpus(tmCorp)
    summary(quantCorp)
}
```

---

corpusSource-class   *corpus source classes*

Description

The `corpusSource` virtual class is a parent class for more specific corpus source objects.

Usage

```
## S4 method for signature 'corpusSource'
show(object)
```

Arguments

object   corpusSource object to be printed

Slots

texts the texts that form the core of the corpus

docvars document variables in a data.frame

source source recorded for the corpus, based on type of source

created a time stamp

cachedfile if read to a temporary file, a string containing the location of the temporary file

---

dfm   *create a document-feature matrix*

Description

Create a sparse matrix document-feature matrix from a corpus or a vector of texts. The sparse matrix construction uses the **Matrix** package, and is both much faster and much more memory efficient than the corresponding dense (regular matrix) representation. For details on the structure of the dfm class, see dfm-class.

Usage

```
dfm(x, ...)

## S3 method for class 'character'
dfm(x, verbose = TRUE, toLower = TRUE,
  removeNumbers = TRUE, removePunct = TRUE, removeSeparators = TRUE,
  removeTwitter = FALSE, stem = FALSE, ignoredFeatures = NULL,
  keptFeatures = NULL, matrixType = c("sparse", "dense"),
  language = "english", thesaurus = NULL, dictionary = NULL,
  dictionary_regex = FALSE, ...)

## S3 method for class 'tokenizedTexts'
dfm(x, verbose = TRUE, toLower = TRUE,
  stem = FALSE, ignoredFeatures = NULL, keptFeatures = NULL,
  matrixType = c("sparse", "dense"), language = "english",
  thesaurus = NULL, dictionary = NULL, dictionary_regex = FALSE, ...)

## S3 method for class 'corpus'
dfm(x, verbose = TRUE, groups = NULL, ...)

is.dfm(x)

as.dfm(x)
```

Arguments

x	corpus or character vector from which to generate the document-feature matrix
...	additional arguments passed to tokenize, which can include for instance ngrams and concatenator for tokenizing multi-token sequences
verbose	display messages if TRUE
toLower	convert texts to lowercase
removeNumbers	remove numbers, see tokenize
removePunct	remove numbers, see tokenize
removeSeparators	
	remove separators (whitespace), see tokenize
removeTwitter	if FALSE, preserve # and @ characters, see tokenize #'
stem	if TRUE, stem words
ignoredFeatures	
	a character vector of user-supplied features to ignore, such as "stop words". Formerly, this was a Boolean option for stopwords = TRUE, but requiring the user to supply the list highlights the choice involved in using any stopword list. To access one possible list (from any list you wish), use stopwords().
keptFeatures	a use supplied regular expression defining which features to keep, while excluding all others. This can be used in lieu of a dictionary if there are only specific features that a user wishes to keep. To extract only Twitter usernames, for example, set keptFeatures = "^@\\w+\\b" and make sure that removeTwitter = FALSE as an additional argument passed to tokenize. (Note: keptFeatures = "^@" will also retrieve usernames, but does not enforce the username convention that a username must contain one and only one @ symbol, at the beginning of the username.)

matrixType	if dense, produce a dense matrix; or it sparse produce a sparse matrix of class dgCMatrix from the **[Matrix](#)** package.
language	Language for stemming and stopwords. Choices are danish, dutch, english, finnish, french, german, hungarian, italian, norwegian, porter, portuguese, romanian, russian, spanish, swedish, turkish for stemming, and SMART, danish, english, french, hungarian, norwegian, russian, swedish, catalan, dutch, finnish, german, italian, portuguese, spanish, arabic for stop-words.
thesaurus	A list of character vector "thesaurus" entries, in a dictionary list format, which can also include regular expressions if dictionary_regex is TRUE (see examples). Note that unlike dictionaries, each entry in a thesaurus key must be unique, otherwise only the first match in the list will be used. Thesaurus keys are converted to upper case to create a feature label in the dfm, as a reminder that this was not a type found in the text, but rather the label of a thesaurus key.
dictionary	A list of character vector dictionary entries, including regular expressions (see examples)
dictionary_regex	
	TRUE means the dictionary is already in regular expression format, otherwise it will be converted from "wildcard" format
groups	character vector containing the names of document variables for aggregating documents

Details

New as of v0.7: All dfms are by default sparse, a change from the previous behaviour. You can still create the older (S3) dense matrix type dfm object, but you will receive a disapproving warning message while doing so, suggesting you make the switch.

is.dfm returns TRUE if and only if its argument is a [dfm](#).

as.dfm coerces a matrix or data.frame to a dfm

Value

A [dfm-class](#) object containing a sparse matrix representation of the counts of features by document, along with associated settings and metadata.

If you used matrixType = "dense" then the return is an old-style S3 matrix class object with additional attributes representing meta-data.

Author(s)

Kenneth Benoit

Examples

```
# with inaugural texts
(size1 <- object.size(dfm(inaugTexts, matrixType="sparse")))
(size2 <- object.size(dfm(inaugTexts, matrixType="dense")))
cat("Compacted by ", round(as.numeric((1-size1/size2)*100), 1), "%.\n", sep="")

# for a corpus
mydfm <- dfm(subset(inaugCorpus, Year>1980))
mydfm <- dfm(subset(inaugCorpus, Year>1980), toLower=FALSE)
```

```
# grouping documents by docvars in a corpus
mydfmGrouped <- dfm(subset(inaugCorpus, Year>1980), groups = "President")

# with stopwords English, stemming, and dense matrix
dfmsInaug2 <- dfm(subset(inaugCorpus, Year>1980),
                  ignoredFeatures=stopwords("english"),
                  stem=TRUE, matrixType="dense")

# with dictionaries
mycorpus <- subset(inaugCorpus, Year>1900)
mydict <- list(christmas=c("Christmas", "Santa", "holiday"),
               opposition=c("Opposition", "reject", "notincorpus"),
               taxing="taxing",
               taxation="taxation",
               taxregex="tax*",

dfm-class   *Virtual class "dfm" for a document-feature matrix*

Description

The dfm class of object is a type of Matrix-class object with additional slots, described below.
quanteda uses two subclasses of the dfm class, depending on whether the object can be represented
by a sparse matrix, in which case it is a dfmSparse class object, or if dense, then a dfmDense object.
See Details.

Usage

```
## S4 method for signature 'dfm'
t(x)

## S4 method for signature 'dfmSparse'
colSums(x, na.rm = FALSE, dims = 1L, ...)

## S4 method for signature 'dfmDense'
colSums(x, na.rm = FALSE, dims = 1L, ...)

## S4 method for signature 'dfmSparse'
rowSums(x, na.rm = FALSE, dims = 1L, ...)

## S4 method for signature 'dfmDense'
rowSums(x, na.rm = FALSE, dims = 1L, ...)

## S3 method for class 'dfm'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmDense,index,index,missing'
x[i = NULL, j = NULL, ...,
  drop = FALSE]

## S4 method for signature 'dfmDense,index,index,logical'
x[i = NULL, j = NULL, ...,
  drop = FALSE]

## S4 method for signature 'dfmDense,index,missing,missing'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmDense,index,missing,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmDense,missing,index,missing'
x[i, j, ..., drop = FALSE]
```

```
## S4 method for signature 'dfmDense,missing,index,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmDense,missing,missing,missing'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmDense,missing,missing,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,index,index,missing'
x[i = NULL, j = NULL, ...,
  drop = FALSE]

## S4 method for signature 'dfmSparse,index,index,logical'
x[i = NULL, j = NULL, ...,
  drop = FALSE]

## S4 method for signature 'dfmSparse,index,missing,missing'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,index,missing,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,missing,index,missing'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,missing,index,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,missing,missing,missing'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,missing,missing,logical'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'dfmSparse,numeric'
e1 + e2

## S4 method for signature 'numeric,dfmSparse'
e1 + e2

## S4 method for signature 'dfmDense,numeric'
e1 + e2

## S4 method for signature 'numeric,dfmDense'
e1 + e2

## S4 method for signature 'dfm'
as.matrix(x)

## S4 method for signature 'dfm'
```

```
as.data.frame(x)
```

Arguments

x	the dfm object
na.rm	if TRUE, omit missing values (including NaN) from the calculations
dims	ignored
...	additional arguments not used here
i	index for documents
j	index for features
drop	always set to FALSE
e1	first quantity in "+" operation for dfm
e2	second quantity in "+" operation for dfm

Details

The dfm class is a virtual class that will contain one of two subclasses for containing the cell counts of document-feature matrixes: dfmSparse or dfmDense.

The dfmSparse class is a sparse matrix version of dfm-class, inheriting dgCMatrix-class from the **Matrix** package. It is the default object type created when feature counts are the object of interest, as typical text-based feature counts tend contain many zeroes. As long as subsequent transformations of the dfm preserve cells with zero counts, the dfm should remain sparse.

When the **Matrix** package implements sparse integer matrixes, we will switch the default object class to this object type, as integers are 4 bytes each (compared to the current numeric double type requiring 8 bytes per cell.)

The dfmDense class is a sparse matrix version of dfm-class, inheriting dgeMatrix-class from the **Matrix** package. dfm objects that are converted through weighting or other transformations into cells without zeroes will be automatically converted to the dfmDense class. This will necessarily be a much larger sized object than one of dfmSparse class, because each cell is recorded as a numeric (double) type requiring 8 bytes of storage.

Slots

settings settings that govern corpus handling and subsequent downstream operations, including the settings used to clean and tokenize the texts, and to create the dfm. See settings.

weighting the feature weighting applied to the dfm. Default is "frequency", indicating that the values in the cells of the dfm are simple feature counts. To change this, use the weight method.

smooth a smoothing parameter, defaults to zero. Can be changed using either the smooth or the weight methods.

Dimnames These are inherited from Matrix-class but are named docs and features respectively.

## End(Not run)
```

---

dictionary   *create a dictionary*

Description

Create a quanteda dictionary, either from a list or by importing from a foreign format. Currently supported formats are the Wordstat and LIWC formats.

Usage

```
dictionary(x = NULL, file = NULL, format = NULL, enc = "",
  tolower = TRUE, maxcats = 10)
```

Arguments

x	a list of character vector dictionary entries, including regular expressions (see examples)
file	file identifier for a foreign dictionary
format	character identifier for the format of the foreign dictionary. Available options are:
	"wordstat" format used by Provalis Research's Wordstat software
	"LIWC" format used by the Linguistic Inquiry and Word Count software
enc	optional encoding value for reading in imported dictionaries. This uses the iconv labels for encoding. See the "Encoding" section of the help for file.
tolower	if TRUE, convert all dictionary functions to lower
maxcats	optional maximum categories to which a word could belong in a LIWC dictionary file, defaults to 10 (which is more than the actual LIWC 2007 dictionary uses). The default value of 10 is likely to be more than enough.

Value

A dictionary class object, essentially a specially classed named list of characters.

Note

We will eventually change this to an S4 class with validators and additional methods.

Examples

```
mycorpus <- subset(inaugCorpus, Year>1900)
mydict <-
    dictionary(list(christmas=c("Christmas", "Santa", "holiday"),
                    opposition=c("Opposition", "reject", "notincorpus"),
                    taxing="taxing",
                    taxation="taxation",
                    taxregex="tax*",
                    country="united states"))
dfm(mycorpus, dictionary=mydict)
## Not run:
# import the Laver-Garry dictionary from http://bit.ly/1FH2nvf
lgdict <- dictionary(file="~/Dropbox/QUANTESS/dictionaries/Misc Provalis/LaverGarry.cat",
                     format="wordstat")
dfm(inaugTexts, dictionary=lgdict)

# import a LIWC formatted dictionary
liwcdict <- dictionary(file = "~/Dropbox/QUANTESS/dictionaries/LIWC/LIWC2001_English.dic",
                       format = "LIWC")
dfm(inaugTexts, dictionary=liwcdict)

## End(Not run)
```

---

docfreq   *get the document frequency of a feature*

Description

For a dfm-class object, returns the number of documents in which a feature in occurs greater than a given frequency threshold. The default is greater than zero, meaning that a feature occurs at least once in a document.

Usage

```
docfreq(object, threshold = 0)

## S4 method for signature 'dfmDense,numeric'
docfreq(object, threshold = 0)

## S4 method for signature 'dfmDense,missing'
docfreq(object, threshold = 0)

## S4 method for signature 'dfmSparse,numeric'
docfreq(object, threshold = 0)

## S4 method for signature 'dfmSparse,missing'
docfreq(object, threshold = 0)

## S4 method for signature 'dfm,numeric'
docfreq(object, threshold = 0)

## S4 method for signature 'dfm,missing'
docfreq(object, threshold = 0)
```

Arguments

`object`	a dfm-class document-feature matrix
`threshold`	numeric value of the threshold *above which* a feature will considered in the computation of document frequency. The default is 0, meaning that a feature's document frequency will be the number of documents in which it occurs greater than zero times.

Value

a numeric vector of document frequencies for each feature

Examples

```
mydfm <- dfm(inaugTexts[1:2], verbose = FALSE)
docfreq(mydfm[, 1:20])
```

---

docnames	*get or set document names*

Description

Extract the document names from a corpus or a document-feature matrix. Document names are the rownames of the documents data.frame in a corpus, or the rownames of the dfm object for a dfm. of the dfm object.

docnames queries the document names of a corpus or a dfm

docnames <- assigns new values to the document names of a corpus. (Does not work for dfm objects, whose document names are fixed.)

Usage

```
docnames(x)

## S3 method for class 'corpus'
docnames(x)

docnames(x) <- value

## S3 method for class 'dfm'
docnames(x)
```

Arguments

x	the object with docnames
value	a character vector of the same length as x

Value

docnames returns a character vector of the document names

docnames<- assigns a character vector of the document names in a corpus

Examples

```
# query the document names of the inaugural speech corpus
docnames(inaugCorpus) <- paste("Speech", 1:ndoc(inaugCorpus), sep="")

# reassign the document names of the inaugural speech corpus
docnames(inaugCorpus) <- paste("Speech", 1:ndoc(inaugCorpus), sep="")
# query the document names of a dfm
docnames(dfm(inaugTexts[1:5]))
```

---

docvars   *get or set for document-level variables*

Description

Get or set variables for the documents in a corpus

Usage

```
docvars(x, ...)

## S3 method for class 'corpus'
docvars(x, field = NULL, ...)

docvars(x, field = NULL) <- value

docvars(x, field = NULL) <- value

## S3 method for class 'corpusSource'
docvars(x, ...)
```

Arguments

x	corpus whose document-level variables will be read or set
...	not used
field	string containing the document-level variable name
value	the new values of the document-level variable

Value

docvars returns a data.frame of the document-level variables

docvars<- assigns value to the named field

Examples

```
head(docvars(inaugCorpus))
docvars(inaugCorpus, "President") <- paste("prez", 1:ndoc(inaugCorpus), sep="")
head(docvars(inaugCorpus))
```

---

encodedTexts   *encoded texts for testing*

Description

encodedTexts is a 10-element character vector with 10 different encodings

Examples

```
Encoding(encodedTexts)
data.frame(labelled = names(encodedTexts), detected = encoding(encodedTexts)$all)
```

---

encoding   *detect the encoding of texts*

Description

Detect the encoding of texts in a character, corpus, or corpusSource-class object and report on the most likely encoding. Useful in detecting the encoding of input texts, so that a source encoding can be specified when (re)constructing a corpus using corpus.

Usage

```
encoding(x, verbose = TRUE, ...)

## S3 method for class 'character'
encoding(x, verbose = TRUE, ...)

## S3 method for class 'corpus'
encoding(x, verbose = TRUE, ...)

## S3 method for class 'corpusSource'
encoding(x, verbose = TRUE, ...)
```

Arguments

x	character vector, corpus, or corpusSource object whose texts' encodings will be detected.
verbose	if FALSE, do not print diagnostic report
...	additional arguments passed to stri_enc_detect

Details

Based on stri_enc_detect, which is in turn based on the ICU libraries. See the ICU User Guide, http://userguide.icu-project.org/conversion/detection.

Examples

```
encoding(encodedTexts)
# show detected value for each text, versus known encoding
data.frame(labelled = names(encodedTexts), detected = encoding(encodedTexts)$all)

encoding(ukimmigTexts)
encoding(inaugCorpus)
encoding(ie2010Corpus)

## Not run: # Russian texts
mytextfile <- textfile("~/Dropbox/QUANTESS/corpora/pozhdata/*.txt", cache = FALSE)
encoding(mytextfile)

## End(Not run)
```

---

exampleString	*A paragraph of text for testing various text-based functions*

Description

This is a long paragraph (2,914 characters) of text taken from an Irish budget speech by Joe Higgins

Format

character vector with one element

Examples

```
tokenize(exampleString, removePunct = TRUE)
```

---

features   *extract the feature labels from a dfm*

Description

Extract the features from a document-feature matrix, which are stored as the column names of the dfm object.

Usage

```
features(x)

## S3 method for class 'dfm'
features(x)
```

Arguments

x   the object (dfm) whose features will be extracted

Value

Character vector of the features

Examples

```
features(dfm(inaugTexts))[1:50]  # first 50 features (alphabetically sorted)
```

---

ie2010Corpus   *Irish budget speeches from 2010*

Description

Speeches and document-level variables from the debate over the Irish budget of 2010.

Format

The corpus object for the 2010 budget speeches, with document-level variables for year, debate, serial number, first and last name of the speaker, and the speaker's party.

Source

Lowe and Benoit (2013)

References

Lowe, Will, and Kenneth R Benoit. 2013. "Validating Estimates of Latent Traits From Textual Data Using Human Judgment as a Benchmark." *Political Analysis* 21: 298-313.

Examples

```
summary(ie2010Corpus)
```

---

inaugCorpus   *A corpus of US presidential inaugural addresses from 1789-2013*

Description

inaugCorpus is the [quanteda-package](#) corpus object of US presidents' inaugural addresses since 1789. Document variables contain the year of the address and the last name of the president.

inaugTexts is the character vector of US presidential inaugaration speeches

References

https://archive.org/details/Inaugural-Address-Corpus-1789-2009 and http://www.presidency.ucsb.edu/inaugurals.php.

Examples

```
# some operations on the inaugural corpus
summary(inaugCorpus)
head(docvars(inaugCorpus), 10)
# working with the character vector only
str(inaugTexts)
head(docvars(inaugCorpus), 10)
mycorpus <- corpus(inaugTexts)
```

---

kwic   *List key words in context from a text or a corpus of texts.*

Description

For a text or a collection of texts (in a quanteda corpus object), return a list of a keyword supplied by the user in its immediate context, identifying the source text and the word index number within the source text. (Not the line number, since the text may or may not be segmented using end-of-line delimiters.)

Usage

```
kwic(x, word, window = 5, wholeword = FALSE)

## S3 method for class 'character'
kwic(x, word, window = 5, wholeword = FALSE)

## S3 method for class 'corpus'
kwic(x, word, window = 5, wholeword = FALSE)
```

Arguments

x	A text character scalar or a quanteda corpus. (Currently does not support character vectors.)
word	A keyword chosen by the user.
window	The number of context words to be displayed around the keyword.
wholeword	If `TRUE`, then only search for the entire "word". Otherwise word is interpreted as a regular expression, which matches any occurrence of word in the text, so that the the concordance will include all words in which the search term appears, and not just when it appears as an entire word. For instance, searching for the word "key" will also return "whiskey". This is the default.

Value

A data frame with the context before (`preword`), the keyword in its original format (`word`, preserving case and attached punctuation), and the context after (`postword`). The rows of the dataframe will be named with the word index position, or the text name and the index position for a corpus object.

Author(s)

Kenneth Benoit and Paul Nulty

Examples

```
kwic(inaugTexts, "terror")
kwic(inaugTexts, "terror", wholeword=TRUE)  # returns only whole word, without trailing punctuation
```

LBGexample	*dfm containing example data from Table 1 of Laver Benoit and Garry (2003)*

Description

Example data to demonstrate the Wordscores algorithm, from Laver Benoit and Garry (2003)

Format

A [dfm](#) object with 6 documents and 37 features

Details

This is the example word count data from Laver, Benoit and Garry's (2003) Table 1. Documents R1 to R5 are assumed to have known positions: -1.5, -0.75, 0, 0.75, 1.5. Document V1 is assumed unknown, and will have a raw text score of approximately -0.45 when computed as per LBG (2003).

References

Laver, Michael, Kenneth Benoit, and John Garry. 2003. "Estimating policy positions from political text using words as data." American Political Science Review 97(2): 311-331.

---

lexdiv *calculate lexical diversity*

Description

Calculate the lexical diversity or complexity of text(s).

Usage

```
lexdiv(x, ...)

## S3 method for class 'dfm'
lexdiv(x, measure = c("TTR", "C", "R", "CTTR", "U", "S",
  "Maas"), log.base = 10, ...)

## S3 method for class 'numeric'
lexdiv(x, measure = c("TTR", "C", "R", "CTTR", "U", "S",
  "Maas"), log.base = 10, ...)
```

Arguments

x	a [document-feature matrix object](#)
...	additional arguments
measure	A character vector defining the measure to calculate.
log.base	A numeric value defining the base of the logarithm.

Details

lexdiv calculates a variety of proposed indices for lexical diversity. In the following formulae, N refers to the total number of tokens, and V to the number of types:

"TTR": The ordinary *Type-Token Ratio*:

$$TTR = \frac{V}{N}$$

"C": Herdan's *C* (Herdan, 1960, as cited in Tweedie & Baayen, 1998; sometimes referred to as *LogTTR*):

$$C = \frac{\log V}{\log N}$$

"R": Guiraud's *Root TTR* (Guiraud, 1954, as cited in Tweedie & Baayen, 1998):

$$R = \frac{V}{\sqrt{N}}$$

"CTTR": Carroll's *Corrected TTR*:

$$CTTR = \frac{V}{\sqrt{2N}}$$

"U": Dugast's *Uber Index* (Dugast, 1978, as cited in Tweedie & Baayen, 1998):

$$U = \frac{(\log N)^2}{\log N - \log V}$$

"S": Summer's index:

$$S = \frac{\log\log V}{\log\log N}$$

"K": Yule's *K* (Yule, 1944, as cited in Tweedie & Baayen, 1998) is calculated by:

$$K = 10^4 \times \frac{(\sum_{X=1}^{X} f_X X^2) - N}{N^2}$$

where N is the number of tokens, X is a vector with the frequencies of each type, and f_X is the frequencies for each X.

"Maas": Maas' indices (a, $\log V_0$ & $\log {}_e V_0$):

$$a^2 = \frac{\log N - \log V}{\log N^2}$$

$$\log V_0 = \frac{\log V}{\sqrt{1 - \frac{\log V}{\log N}^2}}$$

The measure was derived from a formula by Mueller (1969, as cited in Maas, 1972). $\log {}_e V_0$ is equivalent to $\log V_0$, only with e as the base for the logarithms. Also calculated are a, $\log V_0$ (both not the same as before) and V' as measures of relative vocabulary growth while the text progresses. To calculate these measures, the first half of the text and the full text will be examined (see Maas, 1972, p. 67 ff. for details). Note: for the current method (for a dfm) there is no computation on separate halves of the text.

Value

a vector of lexical diversity statistics, each corresponding to an input document

Note

This implements only the static measures of lexical diversity, not more complex measures based on windows of text such as the Mean Segmental Type-Token Ratio, the Moving-Average Type-Token Ratio (Covington & McFall, 2010), the MLTD or MLTD-MA (Moving-Average Measure of Textual Lexical Diversity) proposed by McCarthy & Jarvis (2010) or Jarvis (no year), or the HD-D version of vocd-D (see McCarthy & Jarvis, 2007). These are available from the package **korRpus**.

Author(s)

Kenneth Benoit, adapted from the S4 class implementation written by Meik Michalke in the **koRpus** package.

```
mydfm <- dfm(subset(inaugCorpus, Year>1980))
mydfmSW <- dfm(subset(inaugCorpus, Year>1980), ignoredFeatures=stopwords("english"))
results <- data.frame(TTR = lexdiv(mydfm, "TTR"),
                      CTTR = lexdiv(mydfm, "CTTR"),
                      U = lexdiv(mydfm, "U"),
                      TTRs = lexdiv(mydfmSW, "TTR"),
                      CTTRs = lexdiv(mydfmSW, "CTTR"),
                      Us = lexdiv(mydfmSW, "U"))
results
cor(results)
t(lexdiv(mydfmSW, "Maas"))
```

---

metacorpus   *get or set corpus metadata*

Description

Get or set the corpus-level metadata in a quanteda corpus object.

Usage

```
metacorpus(corp, field = NULL)

metacorpus(corp, field) <- value
```

Arguments

corp	A quanteda corpus object
field	Metadata field name(s). If NULL (default), return all metadata names.
value	new value of the corpus metadata field

Value

For `metacorpus`, a list of the metadata fields in the corpus. If a list is not what you wanted, you can wrap the results in unlist, but this will remove any metadata field that is set to NULL.

For `metacorpus <-`, the corpus with the updated metadata.

Examples

```
metacorpus(inaugCorpus)
metacorpus(inaugCorpus, "source")
metacorpus(inaugCorpus, "citation") <- "Presidential Speeches Online Project (2014)."
metacorpus(inaugCorpus, "citation")
```

metadoc   *get or set document-level meta-data*

Description

Get or set the document-level meta-data, including reserved fields for language and corpus.

Usage

```
metadoc(corp, field = NULL)

metadoc(corp, field = NULL) <- value
```

Arguments

corp   A quanteda corpus object

field   string containing the name of the metadata field(s) to be queried or set

value   the new value of the new meta-data field

Value

For `texts`, a character vector of the texts in the corpus.

For `texts <-`, the corpus with the updated texts.

Note

Document-level meta-data names are preceded by an underscore character, such as `_language`, but when named in in the `field` argument, do *not* need the underscore character.

Examples

```
mycorp <- subset(inaugCorpus, Year>1990)
summary(mycorp, showmeta=TRUE)
metadoc(mycorp, "encoding") <- "UTF-8"
metadoc(mycorp)
metadoc(mycorp, "language") <- "english"
summary(mycorp, showmeta=TRUE)
```

ndoc   *get the number of documents or features*

Description

ndoc returns the number of documents or features in a quanteda object, which can be a corpus, dfm, or tokenized texts.

nfeature is an alias for ntype when applied to dfm objects. For a corpus or set of texts, "features" are only defined through tokenization, so you need to use ntoken to count these.

Usage

```
ndoc(x)

## S3 method for class 'corpus'
ndoc(x)

## S3 method for class 'dfm'
ndoc(x)

nfeature(x)

## S3 method for class 'corpus'
nfeature(x)

## S3 method for class 'dfm'
nfeature(x)
```

Arguments

x	a corpus or dfm object

Value

an integer (count) of the number of documents or features in the corpus or dfm

Examples

```
ndoc(subset(inaugCorpus, Year>1980))
ndoc(dfm(subset(inaugCorpus, Year>1980), verbose=FALSE))
nfeature(dfm(inaugCorpus))
nfeature(trim(dfm(inaugCorpus), minDoc=5, minCount=10))
```

---

ngrams   *Create ngrams*

Description

Create a set of ngrams (words in sequence) from text(s) in a character vector

Usage

```
ngrams(text, n = 2, concatenator = "_", include.all = FALSE, ...)
```

Arguments

text	character vector containing the texts from which ngrams will be extracted
n	the number of tokens to concatenate. Default is 2 for bigrams.
concatenator	character for combining words, default is _ (underscore) character
include.all	if TRUE, add n-1...1 grams to the returned list
...	additional parameters passed to tokenize

Value

a list of character vectors of ngrams, one list element per text

Author(s)

Ken Benoit, Kohei Watanabe, Paul Nulty

Examples

```
ngrams("The quick brown fox jumped over the lazy dog.", n=2)
identical(ngrams("The quick brown fox jumped over the lazy dog.", n=2),
          bigrams("The quick brown fox jumped over the lazy dog."))
ngrams("The quick brown fox jumped over the lazy dog.", n=3)
ngrams("The quick brown fox jumped over the lazy dog.", n=3, concatenator="~")
ngrams("The quick brown fox jumped over the lazy dog.", n=3, include.all=TRUE)
```

---

nsentence	*count the number of sentences*

Description

Return the count of sentences in a corpus or character.

Usage

```
nsentence(x, ...)

## S3 method for class 'character'
nsentence(x, ...)

## S3 method for class 'corpus'
nsentence(x, ...)
```

Arguments

x	texts or corpus whose sentences will be counted
...	additional arguments passed to tokenize

Value

scalar count(s) of the total sentences per text

Note

'nsentence()' relies on the boundaries definitions in the **stringi** package (see stri_opts_brkiter). It does not count sentences correctly if the text has been transformed to lower case, and for this reason 'nsentence()' will stop with an error if it detects all lower-cased text.

Examples

```
# simple example
txt <- c(text1 = "This is a sentence: second part of first sentence.",
         text2 = "A word. Repeated repeated.")
nsentence(txt)
```

---

ntoken   *count the number of tokens or types*

Description

Return the count of tokens (total features) or types (unique features) in a text, corpus, or dfm.
"tokens" here means all words, not unique words, and these are not cleaned prior to counting.

Usage

```
ntoken(x, ...)

ntype(x, ...)

## S3 method for class 'corpus'
ntoken(x, ...)

## S3 method for class 'corpus'
ntype(x, ...)

## S3 method for class 'character'
ntoken(x, ...)

## S3 method for class 'character'
ntype(x, ...)

## S3 method for class 'dfm'
ntoken(x, ...)

## S3 method for class 'dfm'
ntype(x, ...)
```

Arguments

x   texts or corpus whose tokens or types will be counted

...   additional arguments passed to tokenize

Value

scalar count of the total tokens or types

Note

Due to differences between raw text tokens and features that have been defined for a dfm, the counts
be different for dfm objects and the texts from which the dfm was generated. Because the method
tokenizes the text in order to count the tokens, your results will depend on the options passed
through to tokenize

Examples

```
# simple example
txt <- c(text1 = "This is a sentence, this.", text2 = "A word. Repeated repeated.")
ntoken(txt)
ntype(txt)
ntoken(toLower(txt))  # same
ntype(toLower(txt))   # fewer types
ntoken(toLower(txt), removePunct = TRUE)
ntype(toLower(txt), removePunct = TRUE)

# with some real texts
ntoken(subset(inaugCorpus, Year<1806, removePunct = TRUE))
ntype(subset(inaugCorpus, Year<1806, removePunct = TRUE))
ntoken(dfm(subset(inaugCorpus, Year<1800)))
ntype(dfm(subset(inaugCorpus, Year<1800)))
```

---

phrasetotoken   *convert phrases into single tokens*

Description

Replace multi-word phrases in text(s) with a compound version of the phrases concatenated with
concatenator (by default, the "_" character) to form a single token. This prevents tokenization of
the phrases during subsequent processing by eliminating the whitespace delimiter.

Usage

```
phrasetotoken(object, phrases, concatenator = "_")

## S4 method for signature 'character,dictionary'
phrasetotoken(object, phrases,
  concatenator = "_")

phrasetotoken.corpus(object, phrases, concatenator = "_")

## S4 method for signature 'character,collocations'
phrasetotoken(object, phrases,
  concatenator = "_")
```

Arguments

object   source texts, a character or character vector

phrases   a dictionary object that contains some phrases, defined as multiple words de-
                limited by whitespace, up to 9 words long; or a quanteda collocation object
                created by collocations

concatenator   the concatenation character that will connect the words making up the multi-
                word phrases. The default _ is highly recommended since it will not be re-
                moved during normal cleaning and tokenization (while nearly all other punctu-
                ation characters, at least those in the POSIX class [:punct:]) will be removed.

Value

character or character vector of texts with phrases replaced by compound "words" joined by the concatenator

Author(s)

Kenneth Benoit

Examples

```
mytexts <- c("The new law included a capital gains tax, and an inheritance tax.",
             "New York City has raised a taxes: an income tax and a sales tax.")
mydict <- dictionary(list(tax=c("tax", "income tax", "capital gains tax", "inheritance tax")))
(cw <- phrasetotoken(mytexts, mydict))
dfm(cw, verbose=FALSE)

# when used as a dictionary for dfm creation
mydfm2 <- dfm(cw, dictionary=lapply(mydict, function(x) gsub(" ", "_", x)))
mydfm2
# to pick up "taxes" in the second text, set dictionary_regex=TRUE
mydfm3 <- dfm(cw, dictionary=lapply(mydict, phrasetotoken, mydict),
              dictionary_regex=TRUE)
mydfm3
## one more token counted for "tax" than before
```

---

plot.dfm   *plot features as a wordcloud*

Description

The default plot method for a dfm object. Produces a wordcloud plot for the features of the dfm, weighted by the total frequencies. To produce word cloud plots for specific documents, the only way currently to do this is to produce a dfm only from the documents whose features you want plotted.

Usage

```
## S3 method for class 'dfm'
plot(x, ...)
```

Arguments

x   a dfm object

...   additional parameters passed to to wordcloud or to text (and strheight, strwidth)

See Also

wordcloud

Examples

```
# plot the features (without stopwords) from Obama's two inaugural addresses
mydfm <- dfm(subset(inaugCorpus, President=="Obama"), verbose=FALSE,
             ignoredFeatures=stopwords("english"))
plot(mydfm)

# plot only Lincoln's inaugural address
plot(dfm(subset(inaugCorpus, President=="Lincoln"), verbose=FALSE,
     ignoredFeatures=stopwords("english")))

# plot in colors with some additional options passed to wordcloud
plot(mydfm, random.color=TRUE, rot.per=.25, colors=sample(colors()[2:128], 5))
```

---

print.dfm *print a dfm object*

Description

print methods for document-feature matrices

Usage

```
## S4 method for signature 'dfmSparse'
print(x, show.values = FALSE, show.settings = FALSE,
  ...)

## S4 method for signature 'dfmDense'
print(x, show.values = FALSE, show.settings = FALSE,
  ...)

## S4 method for signature 'dfmSparse'
show(object)

## S4 method for signature 'dfmDense'
show(object)

## S3 method for class 'dfm'
print(x, show.values = FALSE, show.settings = FALSE, ...)
```

Arguments

x	the dfm to be printed
show.values	print the dfm as a matrix or array (if resampled).
show.settings	Print the settings used to create the dfm. See settings.
...	further arguments passed to or from other methods
object	the item to be printed

---

readability   *calculate readability*

Description

Calculate the readability of text(s).

Usage

```
readability(x, measure, drop = TRUE)

## S3 method for class 'corpus'
readability(x, measure, drop = TRUE)

## S3 method for class 'character'
readability(x, measure = c("all", "ARI", "ARI.simple",
  "Bormuth", "Bormuth.GP", "Coleman", "Coleman.C2", "Coleman.Liau",
  "Coleman.Liau.grade", "Coleman.short", "Dale.Chall", "Dale.Chall.old",
  "Dale.Chall.PSK", "Danielson.Bryan", "Danielson.Bryan.2", "Dickes.Steiwer",
  "DRP", "ELF", "Farr.Jenkins.Paterson", "Flesch", "Flesch.PSK",
  "Flesch.Kincaid", "FOG", "FOG.PSK", "FOG.NRI", "FORCAST", "FORCAST.RGL",
  "Fucks", "Linsear.Write", "LIW", "nWS", "nWS.2", "nWS.3", "nWS.4", "RIX",
  "Scrabble", "SMOG", "SMOG.C", "SMOG.simple", "SMOG.de",      "Spache",
  "Spache.old", "Strain", "Traenkle.Bailer", "Traenkle.Bailer.2",
  "Wheeler.Smith"), drop = TRUE)
```

Arguments

x	a [corpus](#) object or character vector
measure	character vector defining the readability measure to calculate
drop	if TRUE, the result is returned as a numeric vector if only a single measure is requested; otherwise, a data.frame is returned with each column consisting of a requested measure.

Value

a data.frame object consisting of the documents as rows, and the readability statistics as columns

Author(s)

Kenneth Benoit, re-engineered from the function of the same name by Meik Michalke in the **koRpus** package.

Examples

```
readability(inaugCorpus, measure = "Flesch.Kincaid")
txt <- c("Readability zero one.  Ten, Eleven.", "The cat in a dilapidated tophat.")
readability(txt, "Flesch.Kincaid")
readability(txt, "Flesch.Kincaid", drop = FALSE)
readability(txt, c("FOG", "FOG.PSK", "FOG.NRI"))
inaugReadability <- readability(inaugCorpus, "all")
round(cor(inaugReadability), 3)
```

removeFeatures	*remove features from an object*

Description

This function removes features from a variety of objects, such as text, a dfm, or a list of collocations. The most common usage for removeFeatures will be to eliminate stop words from a text or text-based object. Some commonly used built-in stop words can be accessed through stopwords.

Usage

```
removeFeatures(x, stopwords = NULL, verbose = TRUE, ...)

## S3 method for class 'dfm'
removeFeatures(x, stopwords = NULL, verbose = TRUE, ...)

## S3 method for class 'collocations'
removeFeatures(x, stopwords = NULL, verbose = TRUE,
  pos = c(1, 2, 3), ...)

stopwordsRemove(x, stopwords = NULL, verbose = TRUE)
```

Arguments

x	object from which stopwords will be removed
stopwords	character vector of features to remove. Now requires an explicit list to be supplied, for instance stopwords("english").
verbose	if TRUE print message about how many features were removed
...	additional arguments for some methods (such as pos for collocations)
pos	indexes of word position if called on collocations: remove if word pos is a stopword

Details

Because we believe the user should take full responsibility for any features that are removed, we do not provide a default list. Use stopwords instead.

Value

an object with stopwords removed

Author(s)

Kenneth Benoit

See Also

stopwords

Examples

```
## examples for character objects
someText <- tokenize(c(text1 = "Here's some text containing words we want to remove."))
removeFeatures(someText, stopwords("english"))
removeFeatures(someText, stopwords("SMART"))
removeFeatures(someText, c("some", "want"))
someText <- tokenize(c(text1 = "Here's some text containing words we want to remove.",
                       text2 = "A second sentence with a few stopwords."))
removeFeatures(someText, stopwords("english"))

## for tokenized texts
txt <- c(wash1 <- "Fellow citizens, I am again called upon by the voice of my country to
                   execute the functions of its Chief Magistrate.",
         wash2 <- "When the occasion proper for it shall arrive, I shall endeavor to express
                   the high sense I entertain of this distinguished honor.")
removeFeatures(tokenize(txt), stopwords("english"))

itText <- tokenize("Ecco alcuni di testo contenente le parole che vogliamo rimuovere.",
                   removePunct = TRUE)
removeFeatures(itText, stopwords("italian"), case_insensitive = TRUE)

## example for dfm objects
mydfm <- dfm(ukimmigTexts, verbose=FALSE)
removeFeatures(mydfm, stopwords("english"))

## example for collocations
(myCollocs <- collocations(inaugTexts[1:3], top=20))
removeFeatures(myCollocs, stopwords("english", verbose=FALSE))
```

---

scrabble	*compute the Scrabble letter values of text*

Description

Compute the Scrabble letter values of text given a user-supplied function, such as the sum (default) or mean of the character values.

Usage

```
scrabble(x, FUN = sum)

## S3 method for class 'character'
scrabble(x, FUN = sum)
```

Arguments

x	a character vector
FUN	function to be applied to the character values in the text; default is sum, but could also be mean or a user-supplied function

Value

a vector of Scabble letter values, computed using FUN, corresponding to the input text(s)

Note

Character values are only defined for non-accented Latin a-z, A-Z letters. Lower-casing is unnecessary.

Author(s)

Kenneth Benoit

Examples

```
scrabble(c("muzjiks", "excellency"))
scrabble(inaugTexts[1:5], mean)
```

---

segment   *segment texts into component elements*

Description

Segment text(s) into tokens, sentences, paragraphs, or other sections. segment works on a character vector or corpus object, and allows the delimiters to be defined. See details.

Usage

```
segment(x, ...)

## S3 method for class 'character'
segment(x, what = c("tokens", "sentences", "paragraphs",
  "tags", "other"), delimiter = ifelse(what == "tokens", " ", ifelse(what ==
  "sentences", "[.!?:;]", ifelse(what == "paragraphs", "\\n{2}", ifelse(what
  == "tags", "##\\w+\\b", NULL)))), perl = FALSE, ...)

## S3 method for class 'corpus'
segment(x, what = c("tokens", "sentences", "paragraphs",
  "tags", "other"), delimiter = ifelse(what == "tokens", " ", ifelse(what ==
  "sentences", "[.!?:;]", ifelse(what == "paragraphs", "\\n{2}", ifelse(what
  == "tags", "##\\w+\\b", NULL)))), perl = FALSE, ...)
```

Arguments

x	text or corpus object to be segmented
...	provides additional passed to the regular expression, such as perl=TRUE, or arguments to be passed to clean if what=tokens,
what	unit of segmentation. Current options are tokens, sentences, paragraphs, and other. Segmenting on other allows segmentation of a text on any user-defined value, and must be accompanied by the delimiter argument.
delimiter	delimiter defined as a regex for segmentation. Each type has its own default, except other, which requires a value to be specified.
perl	logical. Should Perl-compatible regular expressions be used?

Details

Tokens are delimited by Separators. For sentences, the delimiter can be defined by the user. The default for sentences includes ., !, ?, plus ; and :.

For paragraphs, the default is two carriage returns, although this could be changed to a single carriage return by changing the value of `delimiter` to `"\\n{1}"` which is the R version of the [regex](#) for one newline character. (You might need this if the document was created in a word processor, for instance, and the lines were wrapped in the window rather than being hard-wrapped with a newline character.)

Value

A list of segmented texts, with each element of the list correponding to one of the original texts.

Note

Does not currently record document segments if segmenting a multi-text corpus into smaller units. For this, use [changeunits](#) instead.

Examples

```
# same as tokenize()
identical(tokenize(ukimmigTexts, lower=FALSE), segment(ukimmigTexts, lower=FALSE))

# segment into paragraphs
segment(ukimmigTexts[3:4], "paragraphs")

# segment a text into sentences
segmentedChar <- segment(ukimmigTexts, "sentences")
segmentedChar[2]
testCorpus <- corpus("##INTRO This is the introduction.
                      ##DOC1 This is the first document.
                      Second sentence in Doc 1.
                      ##DOC3 Third document starts here.
                      End of third document.")
testCorpusSeg <- segment(testCorpus, "tags")
summary(testCorpusSeg)
texts(testCorpusSeg)
# segment a corpus into sentences
segmentedCorpus <- segment(corpus(ukimmigTexts), "sentences")
identical(ndoc(segmentedCorpus), length(unlist(segmentedChar)))
```

---

selectFeatures *select features from an object*

Description

This function selects or discards features from a dfm.variety of objects, such as tokenized texts, a dfm, or a list of collocations. The most common usage for `removeFeatures` will be to eliminate stop words from a text or text-based object, or to select only features from a list of regular expression.

Usage

```
selectFeatures(x, features, ...)

## S3 method for class 'dfm'
selectFeatures(x, features = NULL, selection = c("keep",
  "remove"), valuetype = c("glob", "regex", "fixed"),
  case_insensitive = TRUE, verbose = TRUE, ...)
```

Arguments

x	object whose features will be selected
features	character vector of regexregular expressions definding the features to be selected, or a dictionary class object whose values will provide the features to be selected. If a dictionary class object, the values will be interpreted as regular expressions. (We may add the option for other formats in the next revision.)
...	supplementary arguments passed to the underlying functions in `stri_detect_regex`. (This is how case_insensitive is passed, but you may wish to pass others.)
selection	whether to keep or remove the features
valuetype	how to interpret feature vector: fixed for words as is; ″regex″ for regular expressions; or ″glob″ for "glob"-style wildcard
case_insensitive	
	ignore the case of dictionary values if TRUE
verbose	if TRUE print message about how many features were removed

Note

This function selects features based on their labels. To select features based on the values of a the document-feature matrix, use trim.

See Also

removeFeatures, trim

Examples

```
myDfm <- dfm(c("My Christmas was ruined by your opposition tax plan.",
               "Does the United_States or Sweden have more progressive taxation?"),
             verbose = FALSE)
mydict <- dictionary(list(countries = c("United_States", "Sweden", "France"),
                          wordsEndingInY = c("by", "my"),
                          notintext = "blahblah"))
selectFeatures(myDfm, mydict)
selectFeatures(myDfm, mydict, case_insensitive = TRUE)
selectFeatures(myDfm, c("s$", ".y"), "keep", valuetype = "regex")
selectFeatures(myDfm, c("s$", ".y"), "remove", valuetype = "regex")
selectFeatures(myDfm, stopwords("english"), "keep", valuetype = "fixed")
selectFeatures(myDfm, stopwords("english"), "remove", valuetype = "fixed")
```

---

settings   *Get or set the corpus settings*

Description

Get or set the corpus settings

Get or set various settings in the corpus for the treatment of texts, such as rules for stemming, stopwords, collocations, etc.

Get the settings from a which a [dfm](#) was created

Usage

```
settings(x, ...)

## Default S3 method:
settings(x = NULL, ...)

## S3 method for class 'corpus'
settings(x, field = NULL, ...)

settings(x, field) <- value

## S3 method for class 'dfm'
settings(x, ...)

## S3 method for class 'settings'
print(x, ...)
```

Arguments

x	object from/to which settings are queried or applied
...	additional arguments
field	string containing the name of the setting to be set or queried settings(x) query the corps settings
	settings(x, field) <- update the corpus settings for field
value	new setting value

Details

Calling `settings()` with no arguments returns a list of system default settings.

Examples

```
settings(inaugCorpus, "stopwords")
(tempdfm <- dfm(subset(inaugCorpus, Year>1980), verbose=FALSE))
(tempdfmSW <- dfm(subset(inaugCorpus, Year>1980),
                  ignoredFeatures=stopwords("english"), verbose=FALSE))
settings(inaugCorpus, "stopwords") <- TRUE
tempdfm <- dfm(inaugCorpus, stem=TRUE, verbose=FALSE)
settings(tempdfm)
```

show,dictionary-method

print a dictionary object

Description

Print/show method for dictionary objects.

Usage

```
## S4 method for signature 'dictionary'
show(object)
```

Arguments

object   the dictionary to be printed

---

similarity   *compute similarities between documents and/or features*

Description

Compute similarities between documents and/or features from a [dfm]. Uses the similarity measures defined in [simil]. See [pr_DB] for available distance measures, or how to create your own.

Usage

```
similarity(x, selection, n = 10, margin = c("features", "documents"),
  method = "correlation", sort = TRUE, normalize = TRUE, digits = 4)

## S4 method for signature 'dfm,index'
similarity(x, selection, n = 10,
  margin = c("features", "documents"), method = "correlation",
  sort = TRUE, normalize = TRUE, digits = 4)
```

Arguments

x	a [dfm] object
selection	character or character vector of document names or feature labels from the dfm
n	the top n most similar items will be returned, sorted in descending order. If n is NULL, return all items.
margin	identifies the margin of the dfm on which similarity will be computed: features for word/term features or documents for documents.
method	a valid method for computing similarity from [pr_DB]
sort	sort results in descending order if TRUE
normalize	if TRUE, normalize the dfm by term frequency within document (so that the dfm values will be relative term frequency within each document)
digits	digits for rounding results

Value

a named list of the selection labels, with a sorted named vector of similarity measures.

Note

The method for computing feature similarities can be quite slow when there are large numbers of feature types. Future implementations will hopefully speed this up.

Examples

```
# create a dfm from inaugural addresses from Reagan onwards
presDfm <- dfm(subset(inaugCorpus, Year>1980), ignoredFeatures=stopwords("english"),
               stem=TRUE)

# compute some document similarities
similarity(presDfm, "1985-Reagan", n=5, margin="documents")
similarity(presDfm, c("2009-Obama" , "2013-Obama"), n=5, margin="documents")
similarity(presDfm, c("2009-Obama" , "2013-Obama"), n=NULL, margin="documents")
similarity(presDfm, c("2009-Obama" , "2013-Obama"), n=NULL, margin="documents", method="cosine")
similarity(presDfm, "2005-Bush", n=NULL, margin="documents", method="eJaccard", sort=FALSE)

# compute some term similarities
similarity(presDfm, c("fair", "health", "terror"), method="cosine")

## Not run:

# compare to tm
require(tm)
data("crude")
crude <- tm_map(crude, content_transformer(tolower))
crude <- tm_map(crude, removePunctuation)
crude <- tm_map(crude, removeNumbers)
crude <- tm_map(crude, stemDocument)
tdm <- TermDocumentMatrix(crude)
findAssocs(tdm, c("oil", "opec", "xyz"), c(0.75, 0.82, 0.1))
# in quanteda
crudeDfm <- dfm(corpus(crude))
similarity(crudeDfm, c("oil", "opec", "xyz"), normalize=FALSE, digits=2)

## End(Not run)
```

---

sort.dfm   *sort a dfm by one or more margins*

Description

Sorts a [dfm](dfm) by frequency of total features, total features in documents, or both

Usage

```
## S3 method for class 'dfm'
sort(x, decreasing = TRUE, margin = c("features", "docs",
  "both"), ...)
```

Arguments

x	Document-feature matrix created by [dfm](#)
decreasing	TRUE (default) if sort will be in descending order, otherwise sort in increasing order
margin	which margin to sort on `features` to sort by frequency of features, `docs` to sort by total feature counts in documents, and `both` to sort by both
...	additional arguments passed to base method `sort.int`

Value

A sorted [dfm](#) matrix object

Author(s)

Ken Benoit

Examples

```
dtm <- dfm(inaugCorpus)
dtm[1:10, 1:5]
dtm <- sort(dtm)
sort(dtm)[1:10, 1:5]
sort(dtm, TRUE, "both")[1:10, 1:5]  # note that the decreasing=TRUE argument
                                    # must be second, because of the order of the
                                    # formals in the generic method of sort()
```

---

stopwords	*access built-in stopwords*

Description

This function retrieves stopwords from the type specified in the `kind` argument and returns the stopword list as a character vector The default is English.

Usage

```
stopwords(kind = "english", verbose = FALSE)

stopwordsGet(kind = "english")
```

Arguments

kind	The pre-set kind of stopwords (as a character string). Allowed values are `english`, `SMART`, `danish`, `french`, `hungarian`, `norwegian`, `russian`, `swedish`, `catalan`, `dutch`, `finnish`, `german`, `italian`, `portuguese`, `spanish`, `arabic`
verbose	if `FALSE`, suppress the annoying warning note

Details

The stopword list are SMART English stopwords from the SMART information retrieval system (obtained from http://jmlr.csail.mit.edu/papers/volume5/lewis04a/a11-smart-stop-list/english.stop) and a set of stopword lists from the Snowball stemmer project in different languages (obtained from http://svn.tartarus.org/snowball/trunk/website/algorithms/*/stop.txt). Supported languages are arabic, danish, dutch, english, finnish, french, german, hungarian, italian, norwegian, portuguese, russian, spanish, and swedish. Language names are case sensitive.

Value

a character vector of stopwords

A note of caution

Stop words are an arbitrary choice imposed by the user, and accessing a pre-defined list of words to ignore does not mean that it will perfectly fit your needs. You are strongly encourged to inspect the list and to make sure it fits your particular requirements.

Examples

```
stopwords("english")[1:5]
stopwords("italian")[1:5]
stopwords("arabic")[1:5]
```

---

subset.corpus   *extract a subset of a corpus*

Description

Works just like the normal subset command but for corpus objects

Usage

```
## S3 method for class 'corpus'
subset(x, subset = NULL, select = NULL, ...)
```

Arguments

x	corpus object to be subsetted.
subset	logical expression indicating elements or rows to keep: missing values are taken as false.
select	expression, indicating the attributes to select from the corpus
...	additional arguments affecting the summary produced

Value

corpus object

Examples

```
summary(subset(inaugCorpus, Year>1980))
summary(subset(inaugCorpus, Year>1930 & President=="Roosevelt", select=Year))
```

---

summary.corpus   *summarize a corpus or a vector of texts*

Description

Displays information about a corpus or vector of texts. For a corpus, this includes attributes and metadata such as date of number of texts, creation and source. For texts, prints to the console a desription of the texts, including number of types, tokens, and sentences.

Usage

```
## S3 method for class 'corpus'
summary(object, n = 100, verbose = TRUE,
  showmeta = FALSE, ...)

## S3 method for class 'character'
summary(object, verbose = TRUE, ...)

describeTexts(object, verbose = TRUE, ...)
```

Arguments

object	corpus or texts to be summarized
n	maximum number of texts to describe, default=100
verbose	set to FALSE to turn off printed output, for instance if you simply want to assign the output to a data.frame
showmeta	for a corpus, set to TRUE to include document-level meta-data
...	additional arguments affecting the summary produced

Examples

```
# summarize corpus information
summary(inaugCorpus)
summary(inaugCorpus, n=10)
mycorpus <- corpus(ukimmigTexts, docvars=data.frame(party=names(ukimmigTexts)), enc="UTF-8")
summary(mycorpus, showmeta=TRUE)  # show the meta-data
mysummary <- summary(mycorpus, verbose=FALSE)  # (quietly) assign the results
mysummary$Types / mysummary$Tokens              # crude type-token ratio
#
# summarize texts
summary(c("testing this text", "and this one"))
summary(ukimmigTexts)
myTextSummaryDF <- summary(ukimmigTexts, verbose=FALSE)
```

---

syllables *count syllables in a text*

Description

Returns a count of the number of syllables in texts. For English words, the syllable count is exact and looked up from the CMU pronunciation dictionary, from the default syllable dictionary englishSyllables. For any word not in the dictionary, the syllable count is estimated by counting vowel clusters.

englishSyllables is a quanteda-supplied data object consisting of a named numeric vector of syllable counts for the words used as names. This is the default object used to count English syllables. This object that can be accessed directly, but we strongly encourage you to access it only through the syllables() wrapper function.

Usage

```
syllables(x, ...)

## S3 method for class 'character'
syllables(x, syllableDict = quanteda::englishSyllables,
  ...)

## S3 method for class 'tokenizedTexts'
syllables(x,
  syllableDict = quanteda::englishSyllables, ...)
```

Arguments

x	character vector or tokenizedText-class object whose syllables will be counted
...	additional arguments passed to tokenize
syllableDict	optional named integer vector of syllable counts where the names are lower case tokens. When set to NULL (default), then the function will use the quanteda data object englishSyllables, an English pronunciation dictionary from CMU.

Value

If x is a character vector, a named numeric vector of the counts of the syllables in each text, without tokenization. If x consists of (a list of) tokenized texts, then return a list of syllable counts corresponding to the tokenized texts.

Note

All tokens are automatically converted to lowercase to perform the matching with the syllable dictionary, so there is no need to perform this step prior to calling syllables().

Source

englishSyllables is built from the freely available CMU pronunciation dictionary at http://www.speech.cs.cmu.ed

Examples

```
syllables("This is an example sentence.")
syllables(tokenize("This is an example sentence.", simplify=TRUE))
myTexts <- c(text1 = "Text one.",
             text2 = "Superduper text number two.",
             text3 = "One more for the road.")
syllables(myTexts)
syllables(tokenize(myTexts, removePunct = TRUE))
syllables("supercalifragilisticexpialidocious")
```

---

textfile	*read a text corpus source from a file*

Description

Read a text corpus from a source file, where the single file will consist of a set of texts in columns and document variables and document-level meta-data in additional columns. For spreadsheet-like files, the first row must be a header.

Usage

```
textfile(file, textField, encodingFrom = NULL, encodingTo = "UTF-8",
  cache = FALSE, docvarsfrom = c("filenames"), sep = "_",
  docvarnames = NULL, ...)

  ## S4 method for signature
## 'character,index,missing,missing,ANY,missing,missing,missing'
textfile(file,
  textField, encodingFrom = NULL, encodingTo = "UTF-8", cache = FALSE,
  docvarsfrom = c("filenames"), sep = "_", docvarnames = NULL, ...)

  ## S4 method for signature
## 'character,missing,ANY,ANY,ANY,missing,missing,missing'
textfile(file,
  textField, encodingFrom = NULL, encodingTo = "UTF-8", cache = FALSE,
  docvarsfrom = c("filenames"), sep = "_", docvarnames = NULL, ...)

  ## S4 method for signature
## 'character,missing,missing,missing,ANY,character,ANY,ANY'
textfile(file,
  textField, encodingFrom = NULL, encodingTo = "UTF-8", cache = FALSE,
  docvarsfrom = c("filenames"), sep = "_", docvarnames = NULL, ...)
```

Arguments

file	the complete filename to be read. Currently available file types are:
	txt plain text files

> json data in JavaScript Object Notation, consisting of the texts and additional
> document-level variables and document-level meta-data. The text key must
> be identified by specifying a `textField` value.

> csv comma separated value data, consisting of the texts and additional document-
> level variables and document-level meta-data. The text file must be identi-
> fied by specifying a `textField` value.

> **a wildcard value** any valid pathname with a wildcard ("glob") expression that
> can be expanded by the operating system. This may consist of multiple file
> types.

> xml: Basic flat XML documents are supported – those of the kind supported by
> the function xmlToDataFrame function of the **XML** package.

> doc, docx: Word files coming soon.

> pdf: Adobe Portable Document Format files, coming soon.

textField a variable (column) name or column number indicating where to find the texts
that form the documents for the corpus. This must be specified for file types
`.csv` and `.json`.

encodingFrom a single character value specifying the input file encoding, or a vector of char-
acter values where each element corresponds to a single file, if a filemask or
multiple filenames are supplied as `file`. These work in the same was as the
`encoding` argument supplied to [file](#), which uses the naming conventions and
conversion functions of [iconv](#). If no `encodingFrom` argument is supplied, then
the default encoding is assumed, which may very well be incorrect. Currently,
this argument only works when reading text (`txt`) files.

encodingTo an optional value that can specify the encoding you wish the files to be converted
to, but we strongly encourage you to use the default of UTF-8.

cache If TRUE, write the object to a temporary file and store the temporary filename in
the [corpusSource-class](#) object definition. If FALSE, return the data in the object.
Caching the file provides a way to read in very large quantities of textual data
without storing two copies in memory: one as a [corpusSource-class](#) object and
the second as a [corpus](#) class object. It also provides a way to try different set-
tings of encoding conversion when creating a corpus from a [corpusSource-class](#)
object, without having to load in all of the source data again.

docvarsfrom used to specify that docvars should be taken from the filenames, when the
`textfile` inputs are filenames and the elements of the filenames are document
variables, separated by a delimiter (`sep`). This allows easy assignment of doc-
vars from filenames such as `1789-Washington.txt`, `1793-Washington`, etc. by
`sep` or from meta-data embedded in the text file header (`headers`).

sep separator used in filenames to delimit docvar elements if `docvarsfrom="filenames"`
is used

docvarnames character vector of variable names for docvars, if `docvarsfrom` is specified. If
this argument is not used, default docvar names will be used (`docvar1`, `docvar2`,
...).

... additional arguments passed through to other functions

Details

The constructor does not store a copy of the texts, but rather reads in the texts and associated data,
and saves them to a temporary disk file whose location is specified in the [corpusSource-class](#) object.
This prevents a complete copy of the object from cluttering the global environment and consuming
additional space. This does mean however that the state of the file containing the source data will

not be cross-platform and may not be persistent across sessions. So the recommended usage is to load the data into a corpus in the same session in which `textfile` is called.

Value

an object of class corpusSource-class that can be read by corpus to construct a corpus

Author(s)

Kenneth Benoit and Paul Nulty

Examples

```
# Twitter json
mytf1 <- textfile("~/Dropbox/QUANTESS/social media/zombies/tweets.json")
summary(corpus(mytf1), 5)
# generic json - needs a textField specifier
mytf2 <- textfile("~/Dropbox/QUANTESS/Manuscripts/Collocations/Corpora/sotu/sotu.json",
                  textField = "text")
summary(corpus(mytf2))
# text file
mytf3 <- textfile("~/Dropbox/QUANTESS/corpora/project_gutenberg/pg2701.txt", cache = FALSE)
summary(corpus(mytf3))
# multiple text files
mytf4 <- textfile("~/Dropbox/QUANTESS/corpora/inaugural/*.txt", cache = FALSE)
summary(corpus(mytf4))
# multiple text files with docvars from filenames
mytf5 <- textfile("~/Dropbox/QUANTESS/corpora/inaugural/*.txt",
                  docvarsfrom="filenames", sep="-", docvarnames=c("Year", "President"))
summary(corpus(mytf5))
# XML data
mytf6 <- textfile("~/Dropbox/QUANTESS/quanteda_working_files/xmlData/plant_catalog.xml",
                  textField = "COMMON")
summary(corpus(mytf6))
# csv file
write.csv(data.frame(inaugSpeech = texts(inaugCorpus), docvars(inaugCorpus)),
          file = "/tmp/inaugTexts.csv", row.names = FALSE)
mytf7 <- textfile("/tmp/inaugTexts.csv", textField = "inaugSpeech")
summary(corpus(mytf7))
```

---

textmodel   *fit a text model*

Description

Fit a text model to a dfm. Creates an object of virtual class textmodel_fitted-class, whose exact properties (slots and methods) will depend on which model was called (see `model` types below).

Usage

```
textmodel(x, y = NULL, data = NULL, model = c("wordscores", "NB",
  "wordfish", "lda", "ca"), ...)

## S4 method for signature 'dfm,ANY,missing,character'
textmodel(x, y = NULL, data = NULL,
  model = c("wordscores", "NB", "wordfish", "lda", "ca"), ...)

## S4 method for signature 'formula,missing,dfm,character'
textmodel(x, y = NULL,
  data = NULL, model = c("wordscores", "NB", "wordfish", "lda", "ca"), ...)
```

Arguments

x	a quanteda [dfm](#) object containing feature counts by document
y	for supervised models, a vector of class labels or values for training the model, with NA for documents to be excluded from the training set; for unsupervised models, this will be left NULL
data	dfm or data.frame from which to take the formula
model	the model type to be fit. Currently implemented methods are:

> wordscores Fits the "wordscores" model of Laver, Benoit, and Garry (2003). Options include the original linear scale of LBG or the logit scale proposed by Beauchamps (2001). See [textmodel_wordscores](#).
>
> ca Correspondence analysis scaling of the dfm.
>
> NB Fits a Naive Bayes model to the dfm, with options for smoothing, setting class priors, and a choice of multinomial or binomial probabilities.
>
> wordfish Fits the "wordfish" model of Slapin and Proksch (2008).
>
> lda Fit a topic model based on latent Dirichlet allocation. Temporarily removed.
>
> kNN k-nearest neighbour classification, coming soon.

...	additional arguments to be passed to specific model types
formula	An object of class [formula](#) of the form y ~ x1 + x2 + ... (Interactions are not currently allowed for any of the models implemented.) The x variable(s) is typically a [dfm](#), and the y variable a vector of class labels or training values associated with each document.

Value

a textmodel class list, containing the fitted model and additional information specific to the model class. See the methods for specific models, e.g. [textmodel_wordscores](#), etc.

Class hierarchy

Here will go the description of the class hierarchy that governs dispatch for the predict, print, summary methods, since this is not terribly obvious. (Blame it on the S3 system.)

See Also

[textmodel](#), [textmodel_wordscores](#)

Examples

```
ieDfm <- dfm(ie2010Corpus, verbose=FALSE)
refscores <- c(rep(NA, 4), -1, 1, rep(NA, 8))
ws <- textmodel(ieDfm, refscores, model="wordscores", smooth=1)

# alternative formula notation - but slower
# need the - 1 to remove the intercept, as this is literal formula notation
wsform <- textmodel(refscores ~ . - 1, data=ieDfm, model="wordscores", smooth=1)
identical(ws@Sw, wsform@Sw)  # compare wordscores from the two models

# compare the logit and linear wordscores
bs <- textmodel(ieDfm[5:6,], refscores[5:6], model="wordscores", scale="logit", smooth=1)
plot(ws@Sw, bs@Sw, xlim=c(-1, 1), xlab="Linear word score", ylab="Logit word score")

wf <- textmodel(ieDfm, model="wordfish", dir = c(6,5))
wf
```

textmodel_ca   *correspondence analysis of a document-feature matrix*

Description

textmodel_ca implements correspondence analysis scaling on a dfm. Currently the method is a wrapper to ca.matrix in the **ca** package.

Usage

```
textmodel_ca(data, smooth = 0, ...)
```

Arguments

data	the dfm on which the model will be fit
smooth	a smoothing parameter for word counts; defaults to zero.
...	additional arguments passed to ca.matrix

Author(s)

Kenneth Benoit

Examples

```
ieDfm <- dfm(ie2010Corpus)
wca <- textmodel_ca(ieDfm)
summary(wca)
```

---

textmodel_fitted-class

the fitted textmodel classes

Description

The `textmodel` virtual class is a parent class for more specific fitted text models, which are the result of a quantitative text analysis applied to a document-feature matrix.

Details

Available types currently include...

Slots

dfm a [dfm-class](#) document-feature matrix

---

textmodel_wordfish *wordfish text model*

Description

Estimate Slapin and Proksch's (2008) "wordfish" Poisson scaling model of one-dimensional document positions using conditional maximum likelihood.

Usage

```
textmodel_wordfish(data, dir = c(1, 2), priors = c(Inf, Inf, 3, 1),
  tol = c(1e-06, 1e-08))

## S3 method for class 'textmodel_wordfish_fitted'
print(x, n = 30L, ...)

## S4 method for signature 'textmodel_wordfish_fitted'
show(object)

## S4 method for signature 'textmodel_wordfish_predicted'
show(object)
```

Arguments

data	the dfm on which the model will be fit
dir	set global identification by specifying the indexes for a pair of documents such that $\hat{\theta}_{dir[1]} < \hat{\theta}_{dir[2]}$.
priors	priors for θ_i, α_i, ψ_j, and β_j where i indexes documents and j indexes features
tol	tolerances for convergence (explain why a pair)
x	for print method, the object to be printed
n	max rows of dfm to print
...	additional arguments passed to other functions
object	wordfish fitted or predicted object to be shown

Details

The returns match those of Will Lowe's R implementation of wordfish (see the austin package), except that here we have renamed words to be features. (This return list may change.) We have also followed the practice begun with Slapin and Proksch's early implementation of the model that used a regularization parameter of $\text{se}(\sigma) = 3$, through the third element in priors.

Value

An object of class textmodel_fitted_wordfish. This is a list containing:

dir	global identification of the dimension
theta	estimated document positions
alpha	estimated document fixed effects
beta	estimated feature marginal effects
psi	estimated word fixed effects
docs	document labels
features	feature labels
sigma	regularization parameter for betas in Poisson form
ll	log likelihood at convergence
se.theta	standard errors for theta-hats
data	dfm to which the model was fit

Jonathan Slapin and Sven-Oliver Proksch. 2008. "A Scaling Model for Estimating Time-Series Party Positions from Texts." *American Journal of Political Science* 52(3):705-772.

Examples

```
ie2010dfm <- dfm(ie2010Corpus, verbose=FALSE)
wfmodel <- textmodel_wordfish(LBGexample, dir = c(6,5))
wfmodel

## Not run: if (require(austin)) {
        wfmodelAustin <- wordfish(quanteda::as.wfm(LBGexample), dir = c(6,5))
        cor(wfmodel@theta, wfmodelAustin$theta)
}
## End(Not run)
```

---

textmodel_wordscores   *Wordscores text model*

Description

textmodel_wordscores implements Laver, Benoit and Garry's (2003) wordscores method for scaling of a single dimension. This can be called directly, but the recommended method is through textmodel.

Usage

```
textmodel_wordscores(data, scores, scale = c("linear", "logit"), smooth = 0)

## S3 method for class 'textmodel_wordscores_fitted'
predict(object, newdata = NULL,
  rescaling = "none", level = 0.95, verbose = TRUE, ...)

## S3 method for class 'textmodel_wordscores_fitted'
print(x, n = 30L, digits = 2, ...)

## S4 method for signature 'textmodel_wordscores_fitted'
show(object)

## S4 method for signature 'textmodel_wordscores_predicted'
show(object)

## S3 method for class 'textmodel_wordscores_predicted'
print(x, ...)
```

Arguments

data	the dfm on which the model will be fit. Does not need to contain only the training documents, since the index of these will be matched automatically.
scores	vector of training scores associated with each document identified in refData
scale	classic LBG linear posterior weighted word class differences, or logit scale of log posterior differences
smooth	a smoothing parameter for word counts; defaults to zero for the to match the LBG (2003) method.
object	the fitted wordscores textmodel on which prediction will be made
newdata	dfm on which prediction should be made
rescaling	none for "raw" scores; lbg for LBG (2003) rescaling; or mv for the rescaling proposed by Martin and Vanberg (2007). (Note to authors: Provide full details here in documentation.)
level	probability level for confidence interval width
verbose	If TRUE, output status messages
...	additional arguments passed to other functions
x	for print method, the object to be printed
n	max rows of dfm to print
digits	number of decimal places to print for print methods

Details

Fitting a `textmodel_wordscores` results in an object of class `textmodel_wordscores_fitted` containing the following slots:

Value

The `predict` method for a wordscores fitted object returns a data.frame whose rows are the documents fitted and whose columns contain the scored textvalues, with the number of columns depending on the options called (for instance, how many rescaled scores, and whether standard errors were requested.) (Note: We may very well change this soon so that it is a list similar to other existing fitted objects.)

Slots

`scale` `linear` or `logit`, according to the value of `scale`

`Sw` the scores computed for each word in the training set

`x` the dfm on which the wordscores model was called

`y` the reference scores

`call` the function call that fitted the model

`method` takes a value of `wordscores` for this model

predict(ws, rescaling="mv")
predict(ws, rescaling="lbg")

# same as:
(ws2 <- textmodel_wordscores(LBGexample, c(seq(-1.5, 1.5, .75), NA)))
predict(ws2)
```

---

texts   *get corpus texts*

Description

Get the texts in a quanteda corpus object, with grouping options

Usage

```
texts(x, ...)

## S3 method for class 'corpus'
texts(x, groups = NULL, ...)

## S3 method for class 'corpusSource'
texts(x, groups = NULL, ...)
```

Arguments

x	A quanteda corpus object
...	not currently used
groups	character vector containing the names of document variables for aggregating documents

Value

For `texts`, a character vector of the texts in the corpus.

For `texts <-`, the corpus with the updated texts.

Examples

```
texts(inaugCorpus)[1]
sapply(texts(inaugCorpus), nchar)  # length in characters of the inaugual corpus texts
str(texts(ie2010Corpus, groups = "party"))
```

---

tokenize   *tokenize a set of texts*

Description

Tokenize the texts from a character vector or from a corpus.

Usage

```
tokenize(x, ...)

## S3 method for class 'character'
tokenize(x, what = c("word", "sentence", "character",
  "fastestword", "fasterword"), removeNumbers = FALSE, removePunct = FALSE,
  removeSeparators = TRUE, removeTwitter = FALSE, ngrams = 1,
  concatenator = "_", simplify = FALSE, verbose = FALSE, ...)

## S3 method for class 'corpus'
tokenize(x, ...)
```

Arguments

x	The text(s) or corpus to be tokenized
...	additional arguments not used
what	the unit for splitting the text, defaults to "word". Available alternatives are c("character", "word", "line_break","sentence"). See stringi-search-boundaries.
removeNumbers	remove tokens that consist only of numbers, but not words that start with digits, e.g. 2day
removePunct	remove all punctuation
removeSeparators	
	remove Separators and separator characters (spaces and variations of spaces, plus tab, newlines, and anything else in the Unicode "separator" category) when removePunct=FALSE. Only applicable for what = "character" (when you probably want it to be FALSE) and for what = "word" (when you probably want it to be TRUE). Note that if what = "word" and you set removePunct = TRUE, then removeSeparators has no effect. Use carefully.
removeTwitter	remove Twitter characters @ and #; set to FALSE if you wish to eliminate these.
ngrams	integer vector of the *n* for *n*-grams, defaulting to 1 (unigrams). For bigrams, for instance, use 2; for bigrams and unigrams, use 1:2. You can even include irregular sequences such as 2:3 for bigrams and trigrams only.
concatenator	character to use in concatenating *n*-grams, default is "_", which is recommended since this is included in the regular expression and Unicode definitions of "word" characters
simplify	if TRUE, return a character vector of tokens rather than a list of length ndoc(texts), with each element of the list containing a character vector of the tokens corresponding to that text.
verbose	if TRUE, print timing messages to the console; off by default

Details

The tokenizer is designed to be fast and flexible as well as to handle Unicode correctly. Most of the time, users will construct dfm objects from texts or a corpus, without calling tokenize() as an intermediate step. Since tokenize() is most likely to be used by more technical users, we have set its options to default to minimal intervention. This means that punctuation is tokenized as well, and that nothing is removed from the

Value

A list of length [ndoc](x) of the tokens found in each text.

a **tokenizedText** (S3) object, essentially a list of character vectors. If simplify=TRUE then return a single character vector.

Note

This replaces an older function named clean(), removed from **quanteda** in version 0.8.1. "Cleaning" by removing certain parts of texts, such as punctuation or numbers, only only works on tokenized texts, although texts of any length can be converted to lower case using [toLower].

Author(s)

Ken Benoit and Paul Nulty

Examples

```
# same for character vectors and for lists
tokensFromChar <- tokenize(inaugTexts[1:3])
tokensFromCorp <- tokenize(subset(inaugCorpus, Year<1798))
identical(tokensFromChar, tokensFromCorp)
str(tokensFromChar)
# returned as a list
head(tokenize(inaugTexts[57])[[1]], 10)
# returned as a character vector using simplify=TRUE
head(tokenize(inaugTexts[57], simplify=TRUE), 10)

# removing punctuation marks and lowercasing texts
head(tokenize(toLower(inaugTexts[57]), simplify=TRUE, removePunct=TRUE), 30)
# keeping case and punctuation
head(tokenize(inaugTexts[57], simplify=TRUE), 30)

## MORE COMPARISONS
txt <- "#textanalysis is MY <3 4U @myhandle gr8 #stuff :-)"
tokenize(txt, removePunct=TRUE)
tokenize(txt, removePunct=TRUE, removeTwitter=TRUE)

#tokenize("great website http://textasdata.com", removeURL=TRUE)

txt <- c(text1="This is $10 in 999 different ways,\n up and down; left and right!",
         text2="@kenbenoit working: on #quanteda 2day\t4ever, http://textasdata.com?page=123.")
tokenize(txt, verbose=TRUE)
tokenize(txt, removeNumbers=TRUE, removePunct=TRUE)
tokenize(txt, removeNumbers=FALSE, removePunct=TRUE)
tokenize(txt, removeNumbers=TRUE, removePunct=FALSE)
tokenize(txt, removeNumbers=FALSE, removePunct=FALSE)
tokenize(txt, removeNumbers=FALSE, removePunct=FALSE, removeSeparators=FALSE)

# character level
tokenize("Great website: http://textasdata.com?page=123.", what="character")
tokenize("Great website: http://textasdata.com?page=123.", what="character",
         removeSeparators=FALSE)

# sentence level
tokenize(c("Kurt Vongeut said; only assholes use semi-colons.",
```

```
            "Today is Thursday in Canberra:  It is yesterday in London.",
            "Today is Thursday in Canberra:  \nIt is yesterday in London.",
            "To be?  Or\not to be?"),
          what = "sentence")
tokenize(inaugTexts[c(2,40)], what = "sentence", simplify = TRUE)
```

---

toLower   *Convert texts to lower case*

Description

Convert texts or tokens to lower case

Usage

```
toLower(x, keepAcronyms = FALSE, ...)

## S3 method for class 'character'
toLower(x, keepAcronyms = FALSE, ...)

## S3 method for class 'tokenizedTexts'
toLower(x, keepAcronyms = FALSE, ...)

## S3 method for class 'corpus'
toLower(x, keepAcronyms = FALSE, ...)
```

Arguments

x	texts to be lower-cased
keepAcronyms	if TRUE, do not lowercase any all-uppercase words
...	additional arguments passed to **stringi** functions, (e.g. `stri_trans_tolower`), such as `locale`

Value

Texts tranformed into their lowercased versions. If x is a character vector or a corpus, return a low-ercased character vector. If x is a list of tokenized texts, then return a list of lower-cased tokenized texts.

Examples

```
test1 <- c(text1 = "England and France are members of NATO and UNESCO",
           text2 = "NASA sent a rocket into space.")
toLower(test1)
toLower(test1, keepAcronyms = TRUE)

test2 <- tokenize(test1, removePunct=TRUE)
toLower(test2)
toLower(test2, keepAcronyms = TRUE)
```

---

topfeatures   *list the most frequent features*

Description

List the most frequently occuring features in a [dfm](dfm)

Usage

```
topfeatures(x, ...)

## S3 method for class 'dfm'
topfeatures(x, n = 10, decreasing = TRUE, ci = 0.95, ...)

## S3 method for class 'dgCMatrix'
topfeatures(x, n = 10, decreasing = TRUE, ...)
```

Arguments

x	the object whose features will be returned
...	additional arguments passed to other methods
n	how many top features should be returned
decreasing	If TRUE, return the n most frequent features, if FALSE, return the n least frequent features
ci	confidence interval from 0-1.0 for use if dfm is resampled

Value

A named numeric vector of feature counts, where the names are the feature labels.

Examples

```
topfeatures(dfm(subset(inaugCorpus, Year>1980), verbose=FALSE))
topfeatures(dfm(subset(inaugCorpus, Year>1980), ignoredFeatures=stopwords("english"),
          verbose=FALSE))
# least frequent features
topfeatures(dfm(subset(inaugCorpus, Year>1980), verbose=FALSE), decreasing=FALSE)
```

---

trim   *Trim a dfm using threshold-based or random feature selection*

Description

Returns a document by feature matrix reduced in size based on document and term frequency, and/or subsampling.

Usage

```
trim(x, minCount = 1, minDoc = 1, nsample = NULL, verbose = TRUE)

## S4 method for signature 'dfm'
trim(x, minCount = 1, minDoc = 1, nsample = NULL,
  verbose = TRUE)

trimdfm(x, ...)
```

Arguments

x	document-feature matrix of [dfm-class](#)
minCount	minimum feature count
minDoc	minimum number of documents in which a feature appears
nsample	how many features to retain (based on random selection)
verbose	print messages
...	only included to allow legacy `trimdfm` to pass arguments to `trim`

Value

A [dfm-class](#) object reduced in features (with the same number of documents)

Note

Trimming a [dfm-class](#) object is an operation based on the values in the document-feature *matrix*. To select subsets of a dfm based on attributes of the features themselves – such as selecting features matching a regular expression, or removing features matching a stopword list, use [selectFeatures](#).

Author(s)

Ken Benoit, inspired by code by Will Lowe (see `trim` from the `austin` package)

See Also

[selectFeatures](#)

Examples

```
dtm <- dfm(inaugCorpus)
dim(dtm)
dtmReduced <- trim(dtm, minCount=10, minDoc=2) # only words occuring >=5 times and in >=2 docs
dim(dtmReduced)
topfeatures(dtmReduced, decreasing=FALSE)
dtmSampled <- trim(dtm, minCount=20, nsample=50)  # sample 50 words over 20 count
dtmSampled # 57 x 50 words
topfeatures(dtmSampled)
```

---

ukimmigTexts   *Immigration-related sections of 2010 UK party manifestos*

Description

Extracts from the election manifestos of 9 UK political parties from 2010, related to immigration
or asylum-seekers.

Format

A named character vector of plain ASCII texts

Examples

```
ukimmigCorpus <- corpus(ukimmigTexts, docvars=data.frame(party=names(ukimmigTexts)))
metadoc(ukimmigCorpus, "language") <- "english"
summary(ukimmigCorpus, showmeta = TRUE)
```

---

weight   *Weight the feature frequencies in a dfm by various methods*

Description

Returns a document by feature matrix with the feature frequencies weighted according to one of
several common methods.

Usage

```
weight(x, ...)

## S4 method for signature 'dfm'
weight(x, type = c("frequency", "relFreq", "relMaxFreq",
  "logFreq", "tfidf"), smooth = 0, normalize = TRUE, verbose = TRUE, ...)

tf(x)

tfidf(x)

smoother(x, smooth)

weighting(object)

## S4 method for signature 'dfm'
weighting(object)
```

Arguments

x	document-feature matrix created by [dfm](#)
...	not currently used
type	The weighting function to aapply to the dfm. One of:

- normTf - Length normalization: dividing the frequency of the feature by the length of the document)
- logTf - The natural log of the term frequency
- tf-idf - Term-frequency * inverse document frequency. For a full explanation, see, for example, http://nlp.stanford.edu/IR-book/html/htmledition/term-frequency-and-weighting-1.html. This implementation will not return negative values.
- maxTf - The term frequency divided by the frequency of the most frequent term in the document
- ppmi - Positive Pointwise Mutual Information

smooth	amount to apply as additive smoothing to the document-feature matrix prior to weighting, default is 0.5, set to smooth=0 for no smoothing.
normalize	if TRUE (default) then normalize the dfm by relative term frequency prior to computing tfidf
verbose	if TRUE output status messages
object	the dfm object for accessing the weighting setting

Details

`tf` is a shortcut for `weight(x, "relFreq")`

`tfidf` is a shortcut for `weight(x, "tfidf")`

`smoother` is a shortcut for `weight(x, "frequency", smooth)`

`weighting` queries (but cannot set) the weighting applied to the dfm.

Value

The dfm with weighted values

`weighting` returns a character object describing the type of weighting applied to the dfm.

Author(s)

Paul Nulty and Kenneth Benoit

Examples

```
dtm <- dfm(inaugCorpus)
x <- apply(dtm, 1, function(tf) tf/max(tf))
topfeatures(dtm)
normDtm <- weight(dtm)
topfeatures(normDtm)
```

```
maxTfDtm <- weight(dtm, type="relMaxFreq")
topfeatures(maxTfDtm)
logTfDtm <- weight(dtm, type="logFreq")
topfeatures(logTfDtm)
tfidfDtm <- weight(dtm, type="tfidf")
topfeatures(tfidfDtm)

# combine these methods for more complex weightings, e.g. as in Section 6.4 of
# Introduction to Information Retrieval
logTfDtm <- weight(dtm, type="logFreq")
wfidfDtm <- weight(logTfDtm, type="tfidf", normalize=FALSE)
```

wordlists   *word lists used in some readability indexes*

Description

wordlists is a named list of character vectors where each list element corresponds to a different readability index. These are:

DaleChall The long Dale-Chall list of 3,000 familiar (English) words needed to compute the Dale-Chall Readability Formula.

Spache The revised Spache word list (see Klare 1975, 73) needed to compute the Spache Revised Formula of readability (Spache 1974.

wordstem   *stem words*

Description

Apply a stemmer to words. This is a wrapper to wordStem designed to allow this function to be called without loading the entire **SnowballC** package. wordStem uses Martin Porter's stemming algorithm and the C libstemmer library generated by Snowball.

Usage

```
wordstem(x, language = "porter")

## S3 method for class 'character'
wordstem(x, language = "porter")

## S3 method for class 'tokenizedTexts'
wordstem(x, language = "porter")

## S3 method for class 'dfm'
wordstem(x, language = "porter")
```

Arguments

x	a character vector or corpus, whose word stems are to be removed
language	the name of a recognized language, as returned by getStemLanguages, or a two- or three-letter ISO-639 code corresponding to one of these languages (see references for the list of codes)

Value

A character vector with as many elements as there are in the input vector with the corresponding elements being the stem of the word. Elements of the vector are converted to UTF-8 encoding before the stemming is performed, and the returned elements are marked as such when they contain non-ASCII characters.
